

Configurazione LDAP multiplo

Per usare piu di un LDAP server oppure piu di uno schema LDAP dello stesso server, in /opt/tomcat8/conf/Catalina/localhost/ creare un file DocWay4.xml con questo contenuto:

```
<?xml version='1.0' encoding='utf-8'?>
<Context displayName="DocWay4" path="/DocWay4" privileged="true"
workDir="work/Catalina/localhost/DocWay4">

<Realm className="org.apache.catalina.realm.CombinedRealm">
    <Realm className="org.apache.catalina.realm.JNDIRealm"
        connectionURL="ldap://192.168.92.140:389"
        connectionName="CN=Ldap,CN=Users,DC=credins,DC=al"
        connectionPassword="Qwerty1"
        referrals="follow"
        userBase="OU=Quota,dc=credins,dc=al"
        userSearch="(sAMAccountName={0})"
        userSubtree="true"
        commonRole="jspuser" />

    <Realm className="org.apache.catalina.realm.JNDIRealm"
        connectionURL="ldap://192.168.92.140:389"
        connectionName="CN=Ldap,CN=Users,DC=credins,DC=al"
        connectionPassword="Qwerty1"
        referrals="follow"
        userBase="cn=Users,dc=credins,dc=al"
        userSearch="(sAMAccountName={0})"
        userSubtree="true"
        commonRole="jspuser" />

</Realm>

</Context>
```
